Executive Summary

The telemarketing campaign achieved an overall conversion rate of 11.70%. While top-of-funnel engagement is strong, with about 68.9% engagement, the primary bottleneck in retention occurs at the final closing stage, indicating a need to refine sales pitch, rather than the lead generation strategy.

Funnel Drop-Off Analysis

Out of the 45,000 total contacts made during the analysed period, 31,000 contacted potential customers – about 68.9% of total contacts made – stayed on the call for longer than 2 minutes, which signalled that they were engaged during the call, and thus put them in the ‘Engaged’ consideration phase.

Here, however, this is where the biggest dropoff ends up occurring. Out of the 31,000 engaged contacts, only 5,000 converted, meaning that 26,000 potential customers, or 83.9% of the 31,000, were lost in the conversion. This is a very worrying stat for the company, as it indicates that while the opening hook of the phone call is highly effective at capturing attention, and keeping potential customers engaged, somewhere along the line, the potential customer’s interest is lost, or the value proposition of the term deposit is failing to convince the customers to buy.

Channel Performance

When segmenting the data by communication channel, clear performance disparities begin to emerge.

Cellular contacts accounted for most of the contacts made, 64.4%, and the total conversion rate is also at its highest, although still low, but it’s at 14.92%. It, however, is worth noting that converted cellular contacts did account for roughly 80% of the overall number of converted customers – 4,000 of the 5,000 customers are cellular contacts.

With telephone, it accounted for the least number of contacts made, at 6.7%, but had the second highest conversion rate, at 13.42%.

There were contacts with an ‘unknown’ contact type, and these accounted for 28.9% of total contacts made. However, the conversion rate was not only the lowest, but it was an abysmal rate of 4.07%, way lower than the other two.

This suggests that not only is the value proposition not retaining potential customers, but that the company may be wasting valuable hours reaching out to customers with unknown contact types.

Actionable Recommendations

Based on the data that has been analysed, these are the actions that are recommended.

Retrain the “Closing” Pitch

Since the massive drop-off happens between the Engaged and Converted stages of the call, it's evident that the sale's team is struggling with closing sales, and not pitching sales. We recommend implementing A/B testing on the actual deposit offer, such as promotional interest rates or payback options, to improve the conversion velocity between the Engaged and the Converted.

Prioritize Cellular Leads

This recommendation doesn't imply completely neglecting landline contacts, but its suggested that the sales team should allocate more budget towards contacting verified cellular numbers. Cellular contacts accounted for a huge portion of the contacted leads, and accounted for most of the converted customers, so it is proving to be a better value than other contact types.

Purge “Unknown” Data

The bank is wasting valuable call hours dialling leads with unknown contacts. It is recommended that the bank explores other forms of cheaper digital marketing, like automated email marketing, for unknown contact types.

Conclusion

From the data analysed, the bank is seeing a massive funnel drop-off between the time potential customers are engaged when its time to try convert them. Based on the 11.7% conversion rate and the insights drawn from them, the following was recommended:

- Retraining the closing pitch to try retaining more potential customers and improve conversion rate.
- Prioritize cellular contacts, since they are the most promising of the contacts made.
- Purging unknowns from the dataset, and using other forms of cheaper digital marketing to reserve resources for the other two contact types.

We believe that with these recommendations, the bank will be able to convert more potential customers into committed customers.
